Let's Start!

Getting Familiarized With Servers

Learning Outcome:

Build the application installation program, using IT development tools available in the market, based on solution architecture features.

Understands the concepts of server, its characteristics and its relation with operating systems.

Can Do Statements:

- I can talk about the server.
- I can describe the different types of server.
- I can tell differences among the different types of server.

Ask your partner:

- How can computers connect to the internet?
- Why is it important to have a safe connection?

Let's Explore!

Listen to a class about Information Systems.

Instructions: Read the text below.

Teacher: Today, we'll talk about the types of servers. Let's start by giving a general definition and describing the types of servers.

Sam: In general terms, a server is a component of a network, which provides computers access to the internet or to a network. This means, that a server is a special-purpose computer which serves other computers which are also called clients.

Teacher: And, who can tell me how to identify a server?

Lea: Actually, a traditional computer can be programmed to be a server. It's not crucial to have specific hardware, but it is necessary to have the correct software installed. This is not a simple task, but you need to know how to do it correctly.

Teacher: That's correct. Now, let's move to the types of servers. Who can tell me how to differentiate them?

Sam: There are many types of servers implemented on a network. However, there are five main types: database, application, print, the Internet, and transaction servers.

Lea: The database server, which is a computer program, provides services to other computers (or clients) based on a client-server model. It's considered as the most popular type. This one is regularly used by companies to store their database catalogs. Then, we have application servers, which provide the business logic or domain.

Sam: Print servers are in charge of controlling all printers in a network. Internet servers are specialized computers, which allow other computers to connect to the Internet. Finally, there are transaction servers, which ensure users will get the data requested; it basically operates only when users request specific data.

Teacher: To conclude, remember all servers are designed to accomplish a specific function, and the software or hardware may change from server to server.

Let's Practice!

Let's talk about the server!

Instructions: Read the text and Underline all the questions within sentences How to / where to / what to + verb.

1. **A:** Do you know how to identify a server?
B: Of course! Traditional computers can be programmed to be a server.
2. **A:** Is there any key to know when to use it?
B: No. You just should know that it is necessary the computers have the correct software installed to start using it.
3. **A:** Do you know how to install software in a computer correctly?
B: Well. The process of installation depends on the type of OS and the program you need to install.
4. **A:** Do you know where to get accurate information about servers and the installation process of the programs?
B: OK. You can learn by yourself reading a procedure manual, but it is not easy. It's better to study in a place specialized in computer systems.
5. **A:** Can you tell me how to connect a server to the clients?
B: Well, it depends on demand. It works according to the clients' request.

Let's Practice!

Let's describe the different types of server!

Instructions: Match column A with column B.

COLUMN A

1. This is a database server,
2. Application servers are programs,
3. Print servers are the ones
4. Internet servers are specialized computers,
5. Transaction servers

COLUMN B

- a. that are in charge of controlling all printers in a network.
- b. which allow other computers to connect to the Internet.
- c. are those that ensure users will get the data requested.
- d. which is a computer program that provides services to other computers or clients.
- e. which provide the business logic or domain.

Extension Activity

Let's write about the types of servers!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about the different types of servers.
- Identify the most important characteristics of the types of servers.
- Write a dialogue talking about the types of servers.
- Use the grammar and the vocabulary related to this lesson.
- Share your dialogue with your class.

Self-Assessment

Yes

No

- I look for more information about the different types of servers.
- I identify the most important characteristics of the types of servers.
- I write a dialogue talking about the types of servers.
- I use the grammar and the vocabulary related to this lesson.
- I share my dialogue with the class.

☐ ☐
☐ ☐
☐ ☐
☐ ☐
☐ ☐

Target Words

- **business logic** (noun): a code that makes it possible for a database to work.
e.g. Then, we have application servers, which provide the business logic or domain.
- **client** (noun): a workstation on a network.
e.g. The database server, which is a computer program, provides services to other computers (or clients).
- **ensure** (verb): to make sure.
e.g. Finally, there are transaction servers, which ensure users will get the data requested.
- **network** (noun): a system or group of elements connected.
e.g. A server is a component of a network, which provides computers access to the internet or to a network.
- **provide** (verb): to give or supply.
e.g. A server is a component of a network, which provides computers access to the internet or to a network.
- **serve** (verb): to work for someone else.
e.g. This means, that a server is a special-purpose computer which serves other computers which are also called clients.

Learning Points

Questions Within Sentences How to / Where to / What to + Verb

You can use question words followed by the infinitive of a verb to ask for information.

This pattern is sometimes followed by certain verbs or phrases. Some of them are as follows:

- Learn
- Discuss
- Have information on
- Know
- Think about
- Give an idea of

Always use the base form of the verb in this pattern.

For example:

- *Learn how **to code***
- *Discuss what **to install first***
- *Have information on where **to go***
- *Know how **to reply***
- *Think about what **to choose***
- *Give an idea of what **to connect***

Examples

- *This is not an easy task; you need to be prepared to know how to do it.*
- *Who can tell me how to differentiate them?*

Types of Servers

A server is an important component of a computer; it allows it to connect to a network and makes interaction possible.

There are different types of servers, each of them is designed with a specific purpose and works on a different way.

There are five main types of servers: Database, application, print, Internet, and transaction servers.

Take a look at the table below to understand the main concepts about them.

Learning Points

SERVERS	
Server Type	Description
Database Server	As its name suggests, this type of server is in charge of storing and handling data. It also requests data and controls database management.
Application Server	This is a server program that defines the business logic or the domain. Thanks to this type of server, the software installation in each workstation is not necessary. Moreover, this server is generally divided into three parts: the Tier (web browser to user), the Tier (business logic app to local network), and the Tier (back-end to large server).
Print Server	It provides shared access to printers, managing all printers connected to a network.
Internet Server	It is a computer connected to the internet. It exchanges data by loading information from a disk to a browser. There are different types of internet servers, such as <i>file</i> , <i>DNS</i> , <i>mail</i> , <i>gopher</i> , and <i>news</i> servers.
Transaction Server	This type of sever handles the operations of software on a network or the internet. Most of the time, transaction servers are composed by particular hardware, software, and networks, which make possible the effective completion of transactions.

Examples

- *There are five main types: database, application, print, Internet, and transaction servers.*
- *The database server, which is a computer program, provides services to other computers.*
