Let's Start!

The Client and Server Model

Learning Outcome:

Build the application installation program, using IT development tools available in the market, based on solution architecture features.

Understands the concepts of server, its characteristics and its relation with operating systems.

Can Do Statements:

- I can explain what a client computer is.
- I can describe what a server computer is.
- I can give examples of both, server operating systems and client operating systems.

Ask your partner:

- What are the elements in a computer network?
- What is the most important characteristic of a server computer?

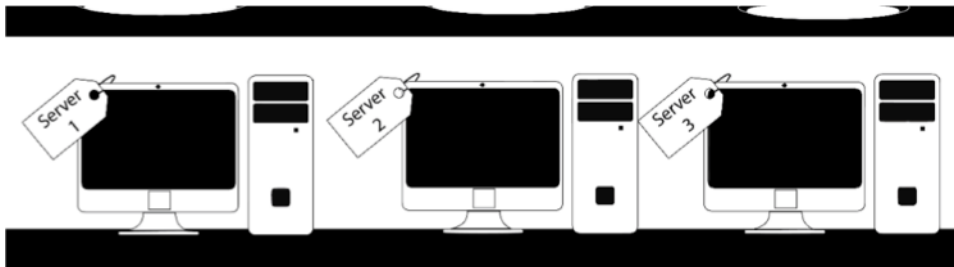

Let's Explore!

Listen to Kim catching up* with a computer lesson she missed.

* "Catch up" means to reach the level of something.

Instructions: Read the text below.

Kim: Joe, help me catch up. What was the main topic you studied during the class yesterday?

Joe: Mr. Smith explained the difference between a client and a server computer.

Kim: I see, and what is the main difference?

Joe: Well, the client computer, which is also known as a workstation, is the computer a person uses to access files and applications through a network. This machine is less expensive and more basic in terms of software. A client can perform simple tasks and request information to the server.

Kim: So, a client computer is the one we usually use. What about the server?

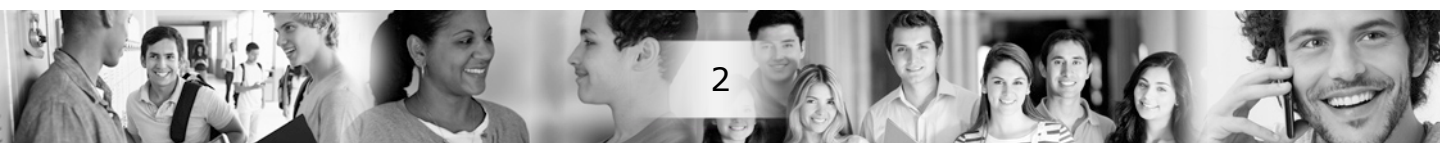

Joe: The server is a computer which serves and supports multiple users to log in and provides service and access to different files. This is called the client-server model, and its use has increased over the past few years.

Kim: What about the software they use?

Joe: Server computers use an operating system that is specifically designed for that use. There are different operating systems (OS) created by the main computer companies. Most of the time you need to pay for a license to use them, and there are just a few which are free; among their main features are cross-platform, file sharing, authentication services, networking, and web hosting.

Kim: And the OS for the client computers?

Joe: There have been traditionally two main OSs which are used by clients all around the world. Both need a license. Although they might share some similarities, there are certain substantial differences between them, including compatibility, manufacturing, distribution, cost and design. However, there are plenty more available, including free license software and other alternative operating systems.

**Let's Practice!**

Let's talk about what a client computer is!

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: which serves / that / person who / that a / which is. Practice saying the sentences aloud. Check your pronunciation with your instructor.

1. The client computer, _____ a workstation, is operated by an end user.
2. A client computer is the one _____ person uses to run some applications.
3. A client is the _____ performs simple tasks and requests information to the server.
4. A client server is the one _____ makes some requests for services that are provided by the main server.
5. A client server performs some service functions at the same time, _____ is done when they make different kinds of requests.

**Let's Practice!**

Let me tell you what a server computer is!

Instructions: Read the text. Select all the correct answers.

It is necessary to know about the definition of a server computer. It allows you to perform your activities correctly. A server computer is an electronic machine, which exchanges data with other machines through wired connections. It is the tool that allows communicating distant machines around the world. The server computer is also the one that serves and supports multiple users to log in a specific webpage, which are available on the network. It is the one that provides service and access to different files, which can be online or offline.

Which of the following statements describe a server computer?

- a. A server computer is an electronic machine exchanges specific information with other machines through wired connections.
- b. A server computer is an electronic machine which can exchange data with other machines through wired connections.
- c. It is the tool that allows distant machines to communicate around the world.
- d. A server computer is also the one that serves and supports multiple users to log in a specific webpages, which are available on the network.
- e. A server computer is the one that only provides service and access to online files but not offline ones.

Extension Activity

Let's write about the server operating systems and the client operating systems!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about examples of both, server operating systems and client operating systems.
- Identify their main characteristics.
- Make a brochure by identifying their similarities and differences.
- Use the grammar and the vocabulary related to this lesson.
- Share your brochure with your class.

Self-Assessment

	Yes	No
1. I look for more information about examples of both, server operating systems and client operating systems.	☐	☐
2. I identify their main characteristics.	☐	☐
3. I make a brochure by identifying their similarities and differences.	☐	☐
4. I use the grammar and the vocabulary related to this lesson	☐	☐
5. I share my brochure with my class.	☐	☐

Target Words

- **authentication** (noun): the process of validating a user and a password in security systems.
e.g. Among their main features are cross-platform, file sharing, authentication services, networking and web hosting.
- **increase** (verb): to become larger in number.
e.g. This is called the client-server model and its use has increased during the past few years.
- **plenty** (adjective): full or enough amount of something.
e.g. However, there are plenty more available, including free license software and other alternative operating systems.
- **share** (verb): to use something with others.
e.g. Although they might share some similarities, there are certain substantial differences between them.
- **support** (verb): to provide help or assistance to someone or something.
e.g. The server is a computer which serves and supports multiple users to log in.
- **substantial** (adjective): important or relevant.
e.g. There are certain substantial differences between them, including compatibility, manufacturing, distribution, cost and design.

Learning Points

Subject and Object Relative Clauses

You can use **subject and object relative clauses** to provide additional information without repeating the subject.

When you use a **subject or an object relative clause**, you are introducing new information with a subordinate clause instead of repeating the subject again.

- ***This is the new software. This software has new features. (Repeated subject.)***

Instead you can say:

- ***This is the new software, which has new features.***

Depending on the subject or object you are talking about, you need to select the appropriate relative pronoun. Look at the chart below to learn more about the **relative pronouns**.

Relative Pronoun	Use
Who	People
Whose	Possessions
Which	Objects
That	Objects

Examples

- *The client computer, which is also known as a workstation, is the computer a person uses to access files and applications through a network.*
- *The server is a computer which serves and supports multiple users to log in and provides service and access to different files.*

The Client and the Server Computers

There are different roles for computers in a network, most of them are clients and there is usually one server.

The client and the server are parts of a model of computing distribution.

Usually, there is one server in a network that sends responses to clients' requests, therefore, the server is always waiting for it. Sometimes it might be necessary for the server to contact other servers to reply the requested data; it can request passwords from clients and host multiple clients.

On the other hand, the client computer is also known as the initiator since it is used by the end user. This is the one that requests information to the server.

A client is a small machine with basic hardware, which allows the user to browse and do simple commands, in contrast to the server, which has higher configurations and is a more powerful machine.

Examples

- *The server is a computer which serves and supports multiple users to log in, provides service and access to different files.*
- *A client can perform simple tasks, and requests information to the server.to it.*
